The PC, which was the spearhead of the personal digital revolution, may seem obsolete alongside exciting new tablets and smartphones. In fact, however, the computer is an intimate participant in the current revolution, changing its own nature to respond to new usage models and a new generation of users. If anything, Microsoft's recent announcement about Surface -- a Windows 8 pc that pretends to be a tablet -- demonstrates the flexibility and importance of the computer in the modern digital age. The new computing revolution is upon us, driven by a crowd of users and developers who are creating new ways to interact with data, and with each other, in an ever-connected world. The new PC has stepped up to address the needs of users and app builders who have never known a world without the Internet. Apple and Microsoft are creating unified operating environments, allowing a seamless transition from mobile to PC or Mac, and all Across cloud services. Windows 8 leads the way, with the same basic operating system at the heart of Windows Phone 8, Windows RT, Windows 8 on PC. The computer is going through the most radical transformation since the advent of IBM PC three decades ago. Critics like to call this a post-PC era, but pc is still the centerpiece of our digital life. We call it a computer, we call it ultrabook, we call it a surface - it's still a PC at heart. It is continuous connectivity, the cloud and ease of mobility that defines today's personal technology revolution. Users had a role in the revolution, embracing the consumption of digital media rather than looking at digital devices as tools. Smartphone and tablet users - in particular, owners of iPhone and iPad - caught in the trail. As at an early age of pc (before IBM PC), the nascent smartphone market was very fragmented, with divergent views about what users want. These days, after the rise of the iPhone, almost all phones look amazingly similar. Having a data plan with your smartphone is now mainstream; It wasn't always like Ultrabooks after a slow start, and PC makers are now embracing change. Inspired by MacBook Air, Intel's Ultrabook software is a mainstream push adopting ultrathin, ultra-transfer computers that offer far fewer compromises than netbook memory. Most of these designs -- including Apple -- are based on Intel devices. The new generation of Ultrabooks has been relatively slow to adopt a always connected model, as surprisingly a few units are charging with built-in cellular broadband. As real 4G networks become more widespread, this may change, especially as cloud storage becomes more integrated with the operating system. Apple is already pursuing this idea with iCloud, and Microsoft will integrate SkyDrive into Windows 8.Ultrabooks is just one response to the changing market, though. Microsoft's new Surface tablets show how computers evolve in other directions. Surface RT is secured in the Microsoft App Store, as much as apple's iPad is locked in iTunes. But Surface Pro is really a high-resolution computer on a tablet, with a fully functional Windows desktop and the ability to run most Windows apps. While the idea of running software from the cloud is not new, it only collects steam. Google led the charge, and Google Docs saw a quick reliance. Microsoft displays Office 365 (a set of hosted productivity applications) to companies. Even games run on the cloud, with companies like Gaikai and OnLive offering games on cloud servers and offering interactive streams to the user's desktops. Apple and Microsoft are leading into unified operating environments across smartphones, tablets and personal computing platforms. In some respects, Microsoft is ahead of the curve. Windows 8, Windows RT, Windows Phone 8 will offer almost identical user experiences. With the release of iOS 6 and Mac OS X Mountain Lion, Apple is taking Step all the way to the user experience integration. Not all users are on board with unified environments, though. Windows 8 seems to be particularly polarizing. Running a Metro interface on a desktop system, or even a laptop, seems to be a puzzling decision by Microsoft, even advertising the surface. Windows 8 and the surface are closely intertwined, and it is clear that Microsoft wants to take the operating system - and its users. Next page: Apple Factor, Mobal Landscape Page 2 Apple has been urged to great success with the iPad, iPhone, and MacBook Air traditional computer manufacturers to explore new designs. Although Apple has not significantly eroded Windows' market share on the desktop, it has gained laptop sales from Apple. The current generation of iMacs has developed a standard for all-in-one systems, while the MacBook Air is a baby sticker for ultrathin mobile devices. The popularity of the air is likely to have generated Ultrabooks - a skinny, lightweight laptop that Intel is currently pushing computer manufacturers to build. Over the next month or two, Intel expects a wave of Ultrabook versions, with dozens of new models flooding the market. MacBook Pro with the new Retina displayThe MacBook Pro with retina display brings 2880-by-1800-pixel resolution - which translates to 220 pixels per inch - to apple's premium laptop line. Computer manufacturers aren't as far away as they seem to be, though: the new crop of 13-inch Ultrabooks with 1080p screens offers 160 ppi. Clearly the bar has been set on the software side, And Apple's AirPlay, which allows easy streaming content to home entertainment systems, has been easily accessible to wireless screens; At this year's E3 Gaming Trade Show, Microsoft announced SmartGlass, which aims to achieve the same goal but will use two-way broadcasting so that it is not just a one-way street. Intel Ivy Bridge's processor delivers prevailing X86 CPU performance with a much lower power budget than previous generations of CPU. While The Ultrabooks first saw daylight with the former Sandy Bridge CPU, it is The Ivy Bridge that is already delivering the promise of longer battery life and new computer shapes and sizes, most of which are more elegant, lighter and more efficient than previous designs. In computex's latest trade show, laptop makers showed a wide range of PC designs - some radical, others consisting of only minor changes to existing designs. For example, Asus Taichi is a laptop that has a touch screen from the outside and acts as a disk when it is closed. Lenovo's Carbon X1 and X11GB both use carbon fiber as the main chassis material. Toshiba is preparing for a 21.9 display-to-rise system with an original resolution of 1792 by 768 pixels, which can offer wide films in its original form. It That designs will win the hearts of consumers, but it's good to see serious experimentation after years of boring, 15.6-inch looks alike. Lenovo IdeaCentre A720D Despite the trend towards mobility, desktopcomputers are still going strong. But they are also changing rapidly. All-in-one systems have become a larger part of the mix, experimenting with manufacturers with other variations. Lenovo IdeaCentre A720, which will ship later this year, offers a multi-touch display that can lie completely horizontally; You might think he's a big brother to the newly announced Microsoft Surface tablets. Ultrasmall units have also become common in offices, homes and industrial settings. Inspired by the interest in Raspberry Pi (a small, super-like computer built around a system on a chip and running Linux), Intel is building nuc (the next unit for computing), which holds the core dual-core CPU Ivy Bridge in a small, 4-inch square case smaller than Apple. Even the most demanding PC users, including players eager for hard performance, are looking beyond the fashionable computer box. For example, Alienware X51 devices pack somewhat dangerous PC gaming muscles into an Xbox-sized chassis. All this experimentation forces us to reconsider what a PC is and what it can become. Asus Windows RT ARM Tablet (Source: IDGNS) It is clear that a tower by the office with an attached screen and peripherals is a PC. All-in-one Windows running machines definitely qualify, as do most laptops. But what if the device is a tablet running Windows RT, Microsoft's next arm-based operating system? No one calls the iPad a PC, but Microsoft Surface RT and similar Windows RT tablets will include some flavor from Microsoft View - an application strongly associated with PCs.An Ultrabook running Windows is definitely a PC. But what about chromebook running on Chrome? It's almost always connected to the cloud, not running Windows - but it's certainly able to run applications that most commercial computer users will recognize. The new Surface Pro may be extremely thin and light, but it's a PC all the way down to the x86 CPU and its ability to run most Windows apps. With the development of the PC, we will see the emergence of new products that drive the PC definition. In some cases, the devices that most of us will not call a computer run applications traditionally associated with personal computers, just like those Windows RT tablets that run office.If the new PC generation simply consists of experiments like Lenovo IdeaCenter A720 and marketing initiatives like Ultrabook, we would see the computer as just evolving with the times. However, Windows 8 and Microsoft's Surface tablets give a different view of the fate of your PC. Apple may have identified what a tablet could be with your iPad, but Microsoft determines the future spirit of the computer.
